

A 3,275% GitHub spike can mean almost nothing.

Percentages hide the denominator.

A move from 1 to 34 commits is real activity, not a verdict.

Cross-check contributor count.

One person pushing harder is different from a growing engineering surface.

Check new repositories and releases.

Work that reaches a release is easier to investigate than a raw commit burst.

**Add external context.
Public engineering activity
is one research input,
alongside your own
diligence.**

**Use the spike to choose
what to investigate.
Not what to predict.**

**Follow GitDealFlow for
weekly method notes.**
